**Abstract:** The possibility of producing more hydrogen during p-alkali atom collisions is discussed. The coupled static approximation is modified for the first time to make it applicable to the multichannel problem of the collisions of p-alkali atoms. The formation of H (1s) and excited H (in 2s- and 2p- states) in the scattering of p-Li atoms is treated to test the convergence of our method. The modified method is used to calculate the total cross-sections of seven partial waves in a range of energy between 50 and 1000 keV. Our p-Li results are compared with earlier ones.

**Key words:** Proton-alkali, hydrogen formation, excited hydrogen formation, cross-sections

### 1. Introduction

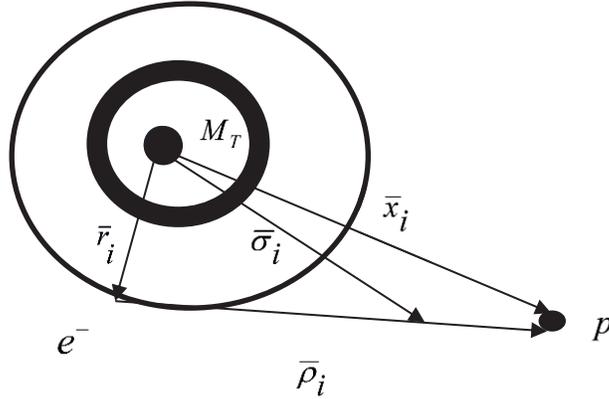

The most interesting phenomenon in quantum mechanics is the intermediate states that appear in a nuclear reaction. Most theoretical and experimental studies of proton-atom interactions have been discussed in the last decade by many authors. They calculated the total cross-sections of the interaction. Banyard and Shirtcliffe [1] discussed p-Li scattering using continuum distorted wave (CDW) approximation. Ferrante and Fiordilino [2] studied p-alkali atoms using eikonal approximations. Daniele et al. [3] reported the total cross-sections for p-alkali atom collision using eikonal approximation. Ferrante et al. [4] also investigated the total H-formation cross-sections in p-alkali atoms using Oppenheimer–Brinkman–Kramers (OBK) approximation. Fritsch and Lin [5] studied p-H atom collisions using the coupled-state calculations method. Choudhury and Sural [6] studied p-alkali atom (Na, K, Rb, Cs) collisions in the wave formation of impulse approximation at energies ranging from 50 to 500 keV. Tiwari [7] reported the differential and total cross-sections in H-formation in the collision of p-Li and p-Na atoms using Coulomb-projected Born approximation.

The present work explores the possibility of producing more hydrogen through p-alkali atom collisions. In the present paper, the coupled static approximation (CSA) method, which is used by Elkilany [8–11], is modified to make it applicable to discuss the multichannel coupled static approximation (MCSA) problem ( $n = 4$ ) of the collision of p-Li atoms at intermediate energies of the projectile. A numerical procedure is generalized to solve the obtained multicoupled equations. Throughout this paper Rydberg units are used and the total cross-sections are expressed in units of  $\pi a_0^2 (= 8.8 \times 10^{-17} \text{cm}^2)$  and energy units of keV.

### 2. Theoretical formalism

The MCSA of protons scattered by alkali atoms may be written as (see Figure 1):

\*Correspondence: sabbelkilany@yahoo.com

**Figure 1.** Configuration space of p-atom scattering:  $\bar{x}_i$  and  $\bar{r}_i$  are the vectors of the proton and the valence electron of the target with respect to the center of mass of the target,  $\bar{\rho}_i$  is the vector of the proton with respect to the valence electron of the target,  $\bar{\sigma}_i$  is the vector of the center of mass of  $H$  from the target, and  $M_T$  is the mass of the nucleus of the target.

$$p + A = \begin{cases} p + A & \text{Elastic channel ( first channel)} \\ H(n\ell) + A^+ & H(n\ell) \text{ formation channels } ((n-1) - \text{channels}) \end{cases}, \quad (1)$$

where  $p$  is the proton,  $A$  is an alkali target atom,  $H(n\ell)$  is hydrogen formation in  $n\ell$ -states, and  $n$  is the number of open channels.

The Hamiltonian of the elastic channel is given by:

$$H = H^{(1)} = H_T - \frac{1}{2\mu_1} \nabla_{x_1}^2 + V_{int}^{(1)}(x_1) = -\frac{1}{2\mu_T} \nabla_{r_1}^2 - \frac{2}{r_1} + V_c(r_1) - \frac{1}{2\mu_1} \nabla_{x_1}^2 + V_{int}^{(1)}(x_1), \quad (2)$$

where  $H_T$  is the Hamiltonian of the target atom.  $\mu_T$  is the reduced mass of the target atom.

$$H = H^{(i)} = H_i - \frac{1}{2\mu_i} \nabla_{\sigma_i}^2 + V_{int}^{(i)}(\sigma_i) = -\frac{1}{2\mu_i} \nabla_{\rho_i}^2 - \frac{2}{\rho_i} - \frac{1}{2\mu_i} \nabla_{\sigma_i}^2 + V_{int}^{(i)}(\sigma_i), \quad i = 2, 3, 4, \dots, n \quad (3)$$

The Hamiltonian of the  $(n-1)$ -rearrangement channels are expressed by:

Here,  $H_i$ ,  $i = 2, 3, 4, \dots, n$  are the Hamiltonians of the hydrogen formation atoms,  $H(n\ell)$ , respectively.  $\mu_i$ ,  $i = 2, 3, 4, \dots, n$  are the reduced masses of  $(n-1)$ - channels, respectively.

$V_c(r_1)$  is a screened potential and  $V_{int}^{(1)}(x_1)$  is the interaction potential of the first channel, given by:

$$V_c(r_1) = V_{cCoul}(r_1) + V_{cex}(r_1), \quad (4)$$

where  $V_{cCoul}(r_1)$  and  $V_{cex}(r_1)$  are the Coulomb and exchange parts of the core potential, respectively (see ref. [11]), and

$$V_{int}^{(1)}(x_1) = \frac{2}{x_1} - \frac{2}{\rho_1} + V_{cCoul}(x_1) \text{ where } V_{cCoul}(x_1) = -V_{cCoul}(r_1), \quad (5)$$

and  $V_{int}^{(i)}(\sigma_i)$ , is the interaction between the two particles of the considered hydrogen formation and the rest of the target, which is given by:

$$V_{int}^{(i)}(\sigma_i) = \frac{2}{x_i} - \frac{2}{r_i} + V_{cCoul}(x_i) + V_{cCoul}(r_i) + V_{cex}(r_i), \quad i = 2, 3, 4, \dots, n. \quad (6)$$

The total energies  $E$  of the  $n$ -channels are defined by:

$$E = E_i + \frac{1}{2\mu_i} k_i^2, \quad i = 1, 2, 3, \dots, n, \quad (7)$$

where  $\frac{1}{2\mu_1} k_1^2$  is the kinetic energy of the incident proton relative to the target and  $\frac{1}{2\mu_i} k_i^2$ ,  $i = 2, 3, 4, \dots, n$  are the kinetic energy of the center of mass of the hydrogen formation atoms,  $H(n\ell)$ , respectively, relative to the nucleus of the target.  $E_1$  is the binding energy of the target atom, and  $E_i$ ,  $i = 2, 3, 4, \dots, n$  refer to the binding energies of the hydrogen formation atoms, respectively.

In MCSA, it is assumed that the projections of the vector  $(H - E)|\Psi\rangle$  onto the bound state of the  $n$ -channels are zero. Thus, the following conditions are satisfied:

$$\langle \Phi_i | (H - E) |\Psi\rangle = 0, \quad i = 1, 2, 3, \dots, n. \quad (8)$$

The total wave function  $|\Psi\rangle$  is expressed by

$$\Psi = \sum_{i=1}^n |\phi_i \psi_i\rangle, \quad (9)$$

$$\psi_1 = \sum_{\ell} \ell(\ell + 1) f_{\ell}^{(1)}(x_1) Y_{\ell}^0(\hat{x}_1), \quad (10)$$

$$\psi_i = \sum_{\ell} \ell(\ell + 1) g_{\ell}^{(i)}(\sigma_i) Y_{\ell}^0(\hat{\sigma}_i), \quad i = 2, 3, \dots, n, \quad (11)$$

where  $f_{\ell}^{(1)}(x_1)$  and  $g_{\ell}^{(i)}(\sigma_i)$ ,  $i = 2, 3, \dots, n$  are the radial wave functions of the elastic and the hydrogen formation atoms, respectively, corresponding to the total angular momentum  $\ell$ .  $Y_{\ell}^0(x_1)$  and  $Y_{\ell}^0(\hat{\sigma}_i)$ ,  $i = 2, 3, \dots, n$  are the related spherical harmonics.  $\hat{x}_1$  and  $\hat{\sigma}_i$ ,  $i = 1, 2, 3, \dots, n$  are the solid angles between the vectors  $\hat{x}_1, \hat{\sigma}_i$ ,  $i = 2, 3, \dots, n$  and the z-axis, respectively.  $\psi_i$ ,  $i = 1, 2, 3, \dots, n$  are the corresponding scattering wave functions of the  $n$ -channels, respectively.  $\Phi_1$  is the wave function for the valence electron of the target atom, which is calculated using ref. [12].  $\Phi_i$ ,  $i = 2, 3, 4, \dots, n$  are the wave functions of the hydrogen formation atoms,  $H(n\ell)$ , respectively, which are defined using a hydrogen-like wave function.

Eq. (8) can be solved by considering differential equations

$$\left[ \frac{d^2}{dx_1^2} - \frac{\ell(\ell + 1)}{x_1^2} + k_1^2 \right] f_{\ell}^{(1)}(x_1) = 2\mu_1 U_{st}^{(1)}(x_1) f_{\ell}^{(1)}(x_1) + \sum_{\alpha=2}^n Q_{1\alpha}(x_1), \quad (12)$$

$$\left[ \frac{d^2}{d\sigma_i^2} - \frac{\ell(\ell + 1)}{\sigma_i^2} + k_i^2 \right] g_{\ell}^{(i)}(\sigma_i) = 2\mu_i U_{st}^{(i)}(\sigma_i) g_{\ell}^{(i)}(\sigma_i) + \sum_{\alpha=1}^n{}' Q_{i\alpha}(\sigma_i), \quad i = 2, 3, \dots, n, \quad (13)$$

where the prime on the sum sign means that  $i \neq \alpha$ , and

$$Q_{1\alpha}(x_1) = \int_0^{\infty} K_{1\alpha}(x_1, \sigma_{\alpha}) g_{\ell}^{(\alpha)}(\sigma_{\alpha}) d\sigma_{\alpha}, \quad \alpha = 2, 3, \dots, n, \quad (14)$$

$$Q_{i1}(\sigma_i) = \int_0^{\infty} K_{i1}(\sigma_i, x_1) f_{\ell}^{(1)}(x_1) dx_1, \quad i = 2, 3, \dots, n, \quad (15)$$

$$Q_{i\alpha}(\sigma_i) = \int_0^{\infty} K_{i\alpha}(\sigma_i, \sigma_{\alpha}) g_{\ell}^{(\alpha)}(\sigma_{\alpha}) d\sigma_{\alpha}, \quad i, \alpha = 2, 3, \dots, n, i \neq \alpha. \quad (16)$$

Kernels  $K_{i\alpha}$ ,  $i = 1, 2, 3, \dots, n, i \neq \alpha$  are expanded by:

$$K_{1\alpha}(x_1, \sigma_{\alpha}) = 2\mu_1(8x_1\sigma_{\alpha}) \iint \Phi_1(r_1) \Phi_{\alpha}(\rho_{\alpha}) \left[ -\frac{1}{2\mu_{\alpha}} (\nabla_{\sigma_{\alpha}}^2 + k_{\alpha}^2) + V_{int}^{(\alpha)} \right] Y_{\ell}^o(\hat{x}_1) Y_{\ell}^o(\hat{\sigma}_{\alpha}) d\hat{x}_1 d\hat{\sigma}_{\alpha}, \quad (17)$$

$$\alpha = 2, 3, \dots, n,$$

$$K_{i1}(\sigma_i, x_1) = 2\mu_i(8\sigma_i x_1) \iint \Phi_i(\rho_i) \Phi_1(r_1) \left[ -\frac{1}{2\mu_1} (\nabla_{x_1}^2 + k_1^2) + V_{int}^{(1)} \right] Y_{\ell}^o(\hat{\sigma}_i) Y_{\ell}^o(\hat{x}_1) d\hat{\sigma}_i d\hat{x}_1, \quad i = 2, 3, \dots, n, \quad (18)$$

$$K_{i\alpha}(\sigma_i, \sigma_{\alpha}) = 2\mu_i(8\sigma_i \alpha_{\alpha}) \iint \Phi_i(\rho_i) \Phi_{\alpha}(\rho_{\alpha}) \left[ -\frac{1}{2\mu_{\alpha}} (\nabla_{\sigma_{\alpha}}^2 + k_{\alpha}^2) + V_{int}^{(\alpha)} \right] Y_{\ell}^o(\hat{\sigma}_i) Y_{\ell}^o(\hat{\sigma}_{\alpha}) d\hat{\sigma}_i d\hat{\sigma}_{\alpha}, \quad (19)$$

$$i, \alpha = 2, 3, \dots, n, i \neq \alpha.$$

The static potentials  $U_{st}^{(1)}(x_1)$  and  $U_{st}^{(i)}(\sigma_i)$ ,  $i = 2, 3, \dots, n$  are defined by

$$U_{st}^{(1)}(x_1) = \langle \Phi_1(r_1) | V_{int}^{(1)} | \Phi_1(r_1) \rangle, \quad U_{st}^{(i)}(\sigma_i) = \langle \Phi_i(\rho_i) | V_{int}^{(i)} | \Phi_i(\rho_i) \rangle. \quad (20)$$

Eqs. (12) and (13) are inhomogeneous equations in  $x_i$ , and  $\sigma_i$ ,  $i = 1, 2, 3, \dots, n$ , and possess the general form

$$(\varepsilon - H_0) |\chi\rangle = |\eta\rangle \quad (21)$$

where  $\varepsilon$  is  $k_i^2$  ( $i = 1, 2, \dots, n$ ).  $H_0$  is  $-\frac{d^2}{dx_1^2} + \frac{\ell(\ell+1)}{x_1^2}$  or  $-\frac{d^2}{d\sigma_i^2} + \frac{\ell(\ell+1)}{\sigma_i^2}$ ,  $i = 2, 3, \dots, n$ .  $|\chi\rangle$  is  $|f_{\ell}^{(1)}(x_1)\rangle$  or  $|g_{\ell}^{(i)}(\sigma_i)\rangle$ .  $|\eta\rangle$  is the right-hand side of the coupled integro-differential equations, respectively.

The solutions of Eqs. (12) and (13) are given (formally) by the Lippmann-Schwinger equation in the form

$$|\chi\rangle = |\chi_0\rangle + G_0 |\eta\rangle, \quad (22)$$

where  $G_0$  is the Green operator  $(\varepsilon - H_0)^{-1}$  and  $|\chi_0\rangle$  is the solution of the homogeneous equation

$$(\varepsilon - H_0) |\chi_0\rangle = |0\rangle, \quad (23)$$

Using Green operator  $G_0$ , the solutions of Eqs. (12) and (13) are given formally by

$$f_{\ell}^{(1,j)}(x_1) = \left\{ \delta_{j1} + \frac{1}{k_1} \int_0^{\infty} \tilde{g}_{\ell}(k_1 x_1) [2\mu_1 U_{st}^{(1)}(x_1) f_{\ell}^{(1,j)}(x_1) + \sum_{\alpha=2}^n Q_{1\alpha}^{(j)}(x_1)] dx_1 \right\} \tilde{f}_{\ell}(k_1 x_1)$$

$$+ \left\{ -\frac{1}{k_1} \int_0^{\infty} \tilde{f}_{\ell}(k_1 x_1) [2\mu_1 U_{st}^{(1)}(x_1) f_{\ell}^{(1,j)}(x_1) + \sum_{\alpha=2}^n Q_{1\alpha}^{(j)}(x_1)] dx_1 \right\} \tilde{g}_{\ell}(k_1 x_1), \quad j = 1, 2, 3, \dots, n \quad (24)$$

$$\begin{aligned}
 g_\ell^{(i,j)}(\sigma_i) = & \left\{ \delta_{ji} + \frac{1}{k_i} \int_0^\infty \tilde{g}_\ell(k_i \sigma_i) [2\mu_i U_{st}^{(i)}(\sigma_i) g_\ell^{(i,j)}(\sigma_i) + \sum_{\alpha=1}^n Q_{i\alpha}(\sigma_i)] d\sigma_i \right\} \tilde{f}_\ell(k_i \sigma_i) \\
 & + \left\{ -\frac{1}{k_i} \int_0^\infty \tilde{f}_\ell(k_i \sigma_i) [2\mu_i U_{st}^{(i)}(\sigma_i) g_\ell^{(i,j)}(\sigma_i) + \sum_{\alpha=1}^n Q_{i\alpha}^{(j)}(\sigma_i)] d\sigma_i \right\} \tilde{g}_\ell(k_i \sigma_i), \quad (25)
 \end{aligned}$$

$i = 2, 3, \dots, n \quad j = 1, 2, 3, \dots, n$

where  $\delta_{ji}$ ,  $i, j = 1, 2, 3, \dots, n$  specify two independent solutions for each of  $f_\ell^{(1,j)}(x_1)$  and  $g_\ell^{(i,j)}(\sigma_i)$ ,  $i = 2, 3, \dots, n$ , according to the considered channel. The functions  $\tilde{f}_l(\eta)$  and  $\tilde{g}_l(\eta)$ ,  $\eta = k_1 x_1$ , or  $\eta = k_i \sigma_i$   $i = 2, 3, \dots, n$  are related to the Bessel functions of the first and second kinds, i.e.  $j_l(\eta)$  and  $y_l(\eta)$ , respectively, by the relations  $\tilde{f}_l(\eta) = \eta j_l(\eta)$  and  $\tilde{g}_l(\eta) = -m y_l(\eta)$ .

The iterative solutions of Eqs. (24) and (25) are calculated by:

$$\begin{aligned}
 f_\ell^{(1,j,\nu)}(x_1) = & \left\{ \delta_{j1} + \frac{1}{k_1} \int_0^{X_1} \tilde{g}_\ell(k_1 x_1) [2\mu_1 U_{st}^{(1)}(x_1) f_\ell^{(1,j,\nu-1)}(x_1) + \sum_{\alpha=2}^n Q_{1\alpha}^{(j,\nu-1)}(x_1)] dx_1 \right\} \tilde{f}_\ell(k_1 x_1) \\
 & + \left\{ -\frac{1}{k_1} \int_0^{X_1} \tilde{f}_\ell(k_1 x_1) [2\mu_1 U_{st}^{(1)}(x_1) f_\ell^{(1,j,\nu-1)}(x_1) + \sum_{\alpha=2}^n Q_{1\alpha}^{(j,\nu-1)}(x_1)] dx_1 \right\} \tilde{g}_\ell(k_1 x_1), \quad (26)
 \end{aligned}$$

$j = 1, 2, 3, \dots, n; \nu \geq 1.$

$$\begin{aligned}
 g_\ell^{(i,j,\nu)}(\sigma_i) = & \left\{ \delta_{ji} + \frac{1}{k_i} \int_0^{\sum_i} \tilde{g}_\ell(k_i \sigma_i) [2\mu_i U_{st}^{(i)}(\sigma_i) g_\ell^{(i,j,\nu)}(\sigma_i) + \sum_{\alpha=1}^n Q_{i\alpha}^{(j,\nu)}(\sigma_i)] d\sigma_i \right\} \tilde{f}_\ell(k_i \sigma_i) \\
 & + \left\{ -\frac{1}{k_i} \int_0^{\sum_i} \tilde{f}_\ell(k_i \sigma_i) [2\mu_i U_{st}^{(i)}(\sigma_i) g_\ell^{(i,j,\nu)}(\sigma_i) + \sum_{\alpha=1}^n Q_{i\alpha}^{(j,\nu)}(\sigma_i)] d\sigma_i \right\} \tilde{g}_\ell(k_i \sigma_i), \quad (27)
 \end{aligned}$$

$i = 2, 3, \dots, n, j = 1, 2, 3, \dots, n; \nu \geq 0.$

Here,  $X_1, \sum_i$ ,  $i = 2, \dots, n$  specify the integration range away from the nucleus over which the integrals of Eqs. (26) and (27) are calculated using Simpson's expansions.

Taylor expansions of  $U_{st}^{(1)}(x_1)$ ,  $\tilde{f}_\ell(k_1 x_1)$  and  $\tilde{g}_\ell(k_1 x_1)$  are used to obtain the starting value of  $f_\ell^{(1,j,0)}(x_1)$  (see ref. [11]).

Equations (26) and (27) can be abbreviated to the following:

$$f_\ell^{(1,j,\nu)}(x_1) = a_1^{(j,\nu)} \tilde{f}_\ell(k_1 x_1) + b_1^{(j,\nu)} \tilde{g}_\ell(k_1 x_1), \quad j = 1, 2, 3, \dots, n; \nu > 0 \quad (28)$$

$$g_\ell^{(i,j,\nu)}(\sigma_i) = a_i^{(j,\nu)} \tilde{f}_\ell(k_i \sigma_i) + b_i^{(j,\nu)} \tilde{g}_\ell(k_i \sigma_i), \quad i = 2, \dots, n, j = 1, 2, 3, \dots, n; \nu > 0 \quad (29)$$

The preceding coefficients of Eqs. (28) and (29) are elements of the matrices  $a^\nu$  and  $b^\nu$ , which are given by:

$$\left. \begin{aligned}
 (a^\nu)_{ij} &= \sqrt{2\mu_{m_i}/k_i} a_i^{(j,\nu)} \\
 (b^\nu)_{ij} &= \sqrt{2\mu_{m_i}/k_i} b_i^{(j,\nu)}, \quad i, j = 1, 2, \dots, n, \nu > 0
 \end{aligned} \right\}, \quad (30)$$

and we can obtain the reactance matrix,  $R^\nu$ , using the following relation:

$$R^\nu = b^\nu (a^\nu)^{-1}, \quad \nu > 0. \quad (31)$$

The partial cross-sections in the present work are determined (in  $\pi a_0^2$ ) by:

$$\sigma_{ij}^{(\ell, \nu)} = \frac{4(2\ell + 1)}{k_1^2} |T_{ij}^\nu|^2, \quad i, j = 1, 2, 3, \dots, n, \quad \nu > 0 \quad (32)$$

where  $k_1$  is the momentum of the incident protons,  $\nu$  is the number of iterations, and  $T_{ij}^\nu$  is the elements of the  $n \times n$  transition matrix  $T^\nu$ , which is given by:

$$T^\nu = R^\nu (I - \tilde{i}R^\nu)^{-1}, \quad \nu > 0, \quad (33)$$

where  $R^\nu$  is the reactance matrix and  $I$  is an  $n \times n$  unit matrix and  $\tilde{i} = \sqrt{-1}$ .

The total cross-sections (in  $\pi a_0^2$  units) can be obtained (in the  $\nu$ th iteration) by:

$$\sigma_{ij}^\nu = \sum_{\ell=0}^{\infty} \sigma_{ij}^{(\ell \nu)}, \quad i, j = 1, 2, 3, \dots, n, \quad \nu > 0 \quad (34)$$

### 3. Proton-lithium scattering

As an application of our MCSA, we are going to apply the above method in the case of  $n = 4$  (four-channels CSA) to the scattering of p-Li. Our problem can be written in the following form:

$$p + Li(2s) = \begin{cases} p + Li(2s) & \text{Elastic channel ( first channel)} \\ H(1s) + Li^+ & H(1s) \text{ formation channel ( second channel)} \\ H(2s) + Li^+ & H(2s) \text{ formation channel ( third channel)} \\ H(2p) + Li^+ & H(2p) \text{ formation channel ( fourth channel)} \end{cases} \quad (35)$$

$\Phi_1(r_1)$  is the valence electron wave function of the target (lithium) atom, which is calculated using Clementi's tables [12], and  $\Phi_i(\rho_i)$ ,  $i = 2, 3, 4$  are the wave functions of the hydrogen formation, which are given by:

$$\Phi_2 = \frac{1}{\sqrt{\pi}} \exp(-\rho_2), \quad \Phi_3 = \frac{1}{\sqrt{32\pi}} (2 - \rho_3) \exp(-\rho_3/2) \text{ and } \Phi_4 = \frac{1}{\sqrt{32\pi}} \rho_4 \cos \theta_{\rho_4, \sigma_4} \exp(-\rho_4/2). \quad (36)$$

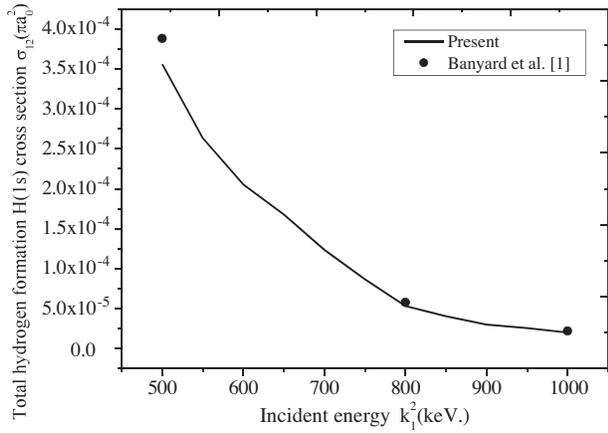

### 4. Results and discussion

We start our calculations on p-Li scattering by testing the variation of the static potentials  $U_{st}^{(1)}(x_1)$  and  $U_{st}^{(i)}(\sigma_i)$ ,  $i = 2, 3, 4$ , of the considered channels with the increase of  $x_1, \sigma_i$  ( $i = 2, 3, 4$ ). In the second step, we consider the integration range,  $IR$ , to be  $32a_0$  with Simpson's interval of 0.0625 to obtain the considered integration. It is found that excellent convergence can be obtained with Simpson's interval of  $h = 0.0625$ ,  $n = 512$  points, and  $\nu = 50$ . We have calculated the total cross-sections of p-Li scattering corresponding to  $0 \leq \ell \leq 6$  at incident energies between 50 and 1000 keV. The Table shows the present total cross-sections of

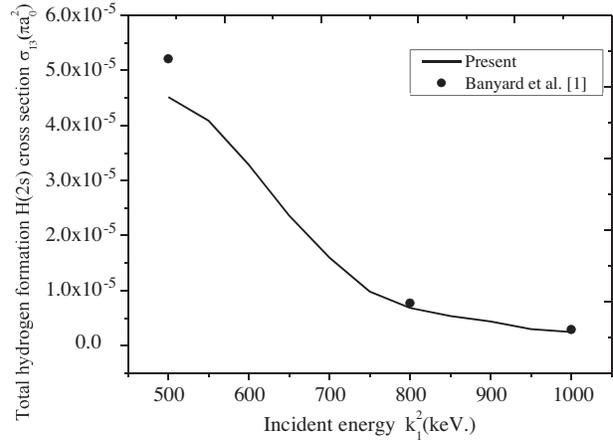

Table. Present  $\sigma_{12}$ ,  $\sigma_{13}$ , and  $\sigma_{14}$  (in  $\pi a_0^2$ ) of p-Li scattering with the results of [1], [2], [3], and [7].

p-Li scattering with those of Banyard and Shirtcliffe [1], Ferrante and Fiordilino [2], Daniele et al. [3], and Tiwari [7] in the energy range of 50–1000 keV. Our results and the available compared results in the range of energy of 500–1000 keV are also displayed in Figures 2–4. In Figure 5 we also show the present results of the total cross-sections of the four channels (elastic and the hydrogen formation ( $H(1s)$ ,  $H(2s)$ ,  $H(2p)$ ) in the same range of energy (50–1000 keV). The present values of the total cross-sections of the four channels have trends similar to the comparison results. Our values of the total cross-sections of the four channels decrease with the incident energies. The calculated total cross-sections  $\sigma_{12}$  of  $H(1s)$  are about 7.85%–8% lower than the results of Banyard and Shirtcliffe [1]. The total cross-sections  $\sigma_{13}$  of  $H(2s)$  are about 11.1%–15.6% lower than those of Banyard and Shirtcliffe [1]. Our results of the total cross-sections  $\sigma_{14}$  of  $H(2p)$  are about 13.5%–18.3% lower than the available values of Banyard and Shirtcliffe [1]. We also noticed that the available compared results of Ferrante and Fiordilino [2], Daniele et al. [3], and Tiwari [7] are higher than our results. The present calculations show that we have more H-formation if we open more excited channels of hydrogen formation in the collision of protons with lithium atoms. The present calculated total cross-sections have the same trend as

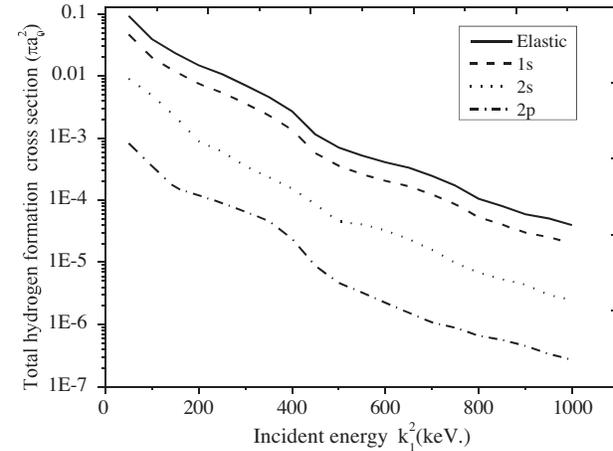

**Figure 2.**  $\sigma_{12}$  ( in  $\pi a_0^2$ ) of p-Li scattering with those of Banyard and Shirtcliffe [1].

**Figure 3.**  $\sigma_{13}$  ( in  $\pi a_0^2$ ) of p-Li scattering with those of Banyard and Shirtcliffe [1].

**Figure 4.**  $\sigma_{14}$  ( in  $\pi a_0^2$ ) of p-Li scattering with those of Banyard and Shirtcliffe [1].

**Figure 5.**  $H(1s)$ ,  $H(2s)$ , and  $H(2p)$  cross-sections ( in  $\pi a_0^2$ ) of p-Li scattering.

the comparison results and give good agreement with the available previous results of Banyard and Shirtcliffe [1].

## 5. Conclusions

p-Li scattering was studied using MCSA as a four-channel problem (elastic,  $H(1s)$ ,  $H(2s)$ , and  $H(2p)$ ). Our interest was focused on the formation of ground,  $H(1s)$ , and excited hydrogen,  $H(2s)$ , and  $H(2p)$  in p-Li scattering. The difference between the four-channel problem and the three- or two-channel problems is in improving the total cross-sections of the considered channel by adding the effect of more kernels of the other three channels (in the two-channel problem, we have only one kernel, and in three channels, we have two kernels), which give more H-formation in the considered states. We expect that we can obtain more hydrogen formation if we open more channels in our calculation, which we will consider in future work.
